ABSTRACT

The starting 5-cyano-6-(3,4-dimethoxyphenyl)-2-thiouracil 1 which prepared by reaction of ethyl cyanoacetate with thiourea and 3,4-dimethoxybenzaldehyde, was allowed to react with POCl3/PCl5 to give the key intermediate 4-chloropyrimidine-2-thione derivative (2). Compound 2 underwent several substitution reactions with sulfadiazine, p-amino acetophenone and benzocaine to give the corresponding substituted 4-amino derivatives 3, 4, 6, respectively. The hydrazides 5, α,β-unsaturated ketone 7 and its cyclized products 8, 9 were also prepared. The imidazopyrimidinthione 10, its Mannich bases and arylmethylene derivatives 11 and 12 were also prepared. Several other pyridoimidazopyrimidine-thiones and triazolopyrimidines were also synthesized. All newly prepared compounds were biologically evaluated for their anticancer activity against cancer cell lines.

Keywords: 2-mercaptopyrimidines, sulfa drugs, α,β-unsaturated ketone, Fused pyrimidines, in vitro anticancer evaluation.

INTRODUCTION

Pyrimidines are among those molecules that make life possible as being some of the building blocks of nucleic acids DNA and RNA. Various analogues of pyrimidine-2-thiones and thiouracil derivatives possess antimetabolic activity against microbial cells, e.g. Lactobacillus arabinosus, L. leichanii, and cancer cells, e.g. Sarcoma 180 in mice [1-3]. Several other pyrimidine-2-thione derivatives are reported to possess antimalarial[4], antiprotozoal[5], antifungal[6], and anticancer activities[7]. Bropirimine; 2-amino-5-bromo-6-phenyl-4(1H)pyrimidinone8 I and anticitabine; 2,2'-anhydro[1β-D-arabinose furanosyl]cytosine II[9] are well-known antiplastic agents of choice.
The therapeutic importance of this class of compounds prompted us to synthesized a series of 5-cyano-6-(3,4-dimethoxyphenyl)-pyrimidine-2-thione derivatives and fused pyrimidines to determine their potential chemotherapeutic activity as anticancer agents against cancer cell lines.

MATERIALS AND METHODS

All melting points are uncorrected and were taken on open capillary tubes using electrothermal apparatus 9100. Elemental micro analyses were carried out at microanalytical unit , Central Services Laboratory, National Research Centre, Dokki, Cairo-Egypt, using Vario Elementar and were found within + or -0.5% of the theoretical values. Infrared spectra were recorded on a Jasco FT/IR-6100, Fourier Transform Infrared Spectrometer at cm\(^{-1}\) scale using KBr disc technique at the Central Services Lab. NRC, Dokki, Cairo, Egypt. 

\(^{1}\)HNMR spectra were determined by using a JEOL EX-270 NMR Spectrometer at Central Services Lab, NRC. Mass spectra were measured with Finnigan M A T SSQ-7000 mass spectrometer at the Central Services, NRC Dokki, Cairo, Egypt. Follow up of the reactions and checking the purity of the compounds were made by TLC on silica gel-precoated aluminum sheets (Type 60 F254-Merck, Darmstadt, Germany) and the spots were detected by exposure to UV Lamp at 254 nanometer for few seconds. Nomenclature given for the new compounds are according to the IUPAC System.

BIOLOGICAL ASSAYS

Cell culture

MCF-7 cell lines were obtained from the Karolinska Institute, Stockholm, Sweden. HEPG-2 cells were maintained in RPMI 1640 medium, while MCF-7 Human cancer cells were maintained in DMEM medium (Lonza Biowhittkar, Belgium). All the media were supplemented with 1% antibiotic-antimycotic mixture (10,000 U ml-1 potassium penicillin, 10,000 μg ml-1 streptomycin sulfate, 25 μg ml-1 amphotericin B and 1% L-glutamine (Biowest, USA).

MTT cytotoxicity assay

Cell viability was investigated using MTT [3-(4,5-dimethylthiazol-2-yl)-2, 5-diphenyltetrazolium bromide] (Bio Basic Canada Inc., Canada). This reaction depends on mitochondrial reduction of yellow MTT into purple formazan.
All the preceding steps were carried out in sterile laminar airflow cabinet Biosafety class II level (Baker, SG403INT; Sanford, ME, USA). All incubations were done at 37 °C in 5% CO2 incubator in the humidified atmosphere (Sheldon, TC2323; Cornelius, OR, USA). Cells were seeded into 96-well microtiter plastic plates at the concentration of (104 cells per well) and allowed to adhere for 24 h. Medium was aspirated and fresh medium (without serum) was added to the cells with 100 µg ml-1 in DMSO then the promising compounds which give 100% inhibition will subjected to various concentrations of the promising compounds (100, 50, 25, 12.5, 6.25, 3.12, 1.56 and 0.78 µg ml-1 in DMSO) and incubated for 48 h. The medium was aspirated and 40 µl MTT salts (2.5 µg ml-1) was added to each correctly and incubated for a further 4 h. To stop the reaction and dissolve any formed formazan crystals, 200 µl of 10% sodium dodecyl sulfate (SDS) were added to each well and incubated overnight at 37 °C. The amount of formazan product was measured at 595 nm with a reference wavelength of 620 nm as a background using a microplate reader (Bio-Rad Laboratories, model 3350, USA). For the untreated cells (negative control), medium was added instead of the test compounds. A positive control Adrinamycin® (doxorubicin) (Mr=579.9) was used as a known cytotoxic natural agent giving 100% inhibition. Dimethyl sulfoxide (DMSO) was the vehicle used for dissolution of testing compound, and its final concentration on the cells was less than 0.2%.

RESULTS AND DISCUSSION

CHEMISTRY

For the purpose of this study, the synthetic approach was confined to two general schemes 1 and 2 to obtain the target polyfunctionally substituted pyrimidine-2-thione derivatives and the related fused Pyrimidines. Thus, reaction of thiourea with 3,4-dimethoxybenzaldehyde and ethyl cyanoacetate in alkaline medium according to a reported method[10], afforded the first starting compound 6-(3,4-dimethoxyphenyl)-4-oxo-2-thioxo-1,2,3,4-tetrahydropyrimidine-5-carbonitrile (1) in almost good yield.

Compound 1 was chlorinated with phosphorus oxychloride/phosphorus pentachloride mixture to give the corresponding 4-chloro-6-(3,4-dimethoxyphenyl)-2-thioxo-1,2-dihydropyrimidine-5-carbonitrile (2), which in turn was allowed to react with sulfa pyridine and/or sulfadiazine to afford the corresponding 4-(p-substituted sulfamoyl aniline-) derivatives 3a and 3b respectively. Reaction of 2 with ethyl p-amino-benzoate and/or p-aminoacetophenone, afforded the corresponding 4-substituted aniline pyrimidine-2-thione derivatives 4 and 6 respectively. Reaction of ethyl 4-((5-cyano-6-(3,4-dimethoxyphenyl)-2-thioxo-1,2-dihydropyrimdin-4-yl)amino)benzoate (4) with hydrazine hydrate, methyl and/or phenyl hydrazine, gave the corresponding substituted carbohydrazides 5a-c respectively. Further, reaction of methyl 4-((5-cyano-6-(3,4-dimethoxyphenyl)-2-thioxo-1,2-dihydropyrimdin-4-yl)amino)benzoate (6) with p-anisaldehyde afforded the corresponding α,β-unsaturated ketone 7 which underwent cyclocondensation reaction with either hydrazine hydrate or methyl and phenyl hydrazine in ethanolic sodium hydroxide solution to give the corresponding N-substituted-dihydropyrazoline derivatives 8a-c respectively. While reaction of 7 with thiourea afforded the corresponding polyfunctionally substituted di-(pyridine-2-thione) derivative 9 (Scheme 1).
On the other hand, 4-chloro-6-(3,4-dimethoxyphenyl)-2-thioxo-1,2-dihydropyrimidine-5-carbonitrile (2) was heated under reflux with glycine in butanol followed by cyclization by heating with acetic anhydride to achieve the corresponding 7-(3,4-dimethoxyphenyl)-3-oxo-5-thioxo-2,3,5,6-tetrahydroimidazo[1,2-c]pyrimidine-8-carbonitrile (10) which was allowed to undergo the Mannich reaction with paraformaldehyde and the appropriate secondary amines, namely, diethylamine, diethanol amine, morpholine, and/or methyl piperazine to give the Mannich bases 11a-d respectively. Also, compound 10 was allowed to react with the appropriate aromatic aldehyde namely, methyl furfural, p-carboxybenzaldehyde, 2,4-dichlorobenzaldehyde, indole-3-carboxaldehyde and/or naphthalene-2-carboxaldehyde to give the corresponding 2-aryl-7-(3,4-dimethoxyphenyl)-3-oxo-5-thioxo-2,3,5,6-tetrahydroimidazo[1,2-c]pyrimidine-8-carbonitrile derivatives 12a-e respectively (Scheme 2).
Further, cyclocondensation of compound 12 with ammonium acetate and ethyl cyanoacetate afforded the 2-oxopyridoimidazopyrimidine derivatives 13a-c, while upon reaction with ammonium acetate and malononitrile, it gave the corresponding pyridoimidazopyrimidine amine derivatives 14a,b respectively.

Furthermore, compound 2 was allowed to react with hydrazine hydrate in ethanol to give the corresponding 4-hydrazino-pyrimidine-2-thione derivative 15 in good yield. The hydrazine derivative 15 underwent cyclocondensation reaction in acetic anhydride to give the corresponding 1,2,4-triazinopyrimidine-2-thione derivative 16 (Scheme 2).

All the newly synthesized compounds were structurally investigated by chemical microanalyses and spectral analyses.

ANTITUMOR ACTIVITY[13-16]
This study exhibited the anti-tumor activity of some of the newly synthesized compounds. Fifteen derivatives were selected as representative examples to examine their in vitro anti-tumor activities against Hep-G2 human liver cancer cell line and MCF-7 human breast cancer cell line. The percentage of the intact cells was measured and tabulated in table 1. The activities of the derivatives against carcinoma cells were compared with the cytotoxicity of
doxorubicin as a reference drug. The results showed that the triazolo[4,3-c]pyrimidine derivative 16 and the tri-fused tetrahydropyrido[3',2':4,5]imidazo[1,2-c]pyrimidine derivative 13c exhibited the highest cytotoxic activity against the liver cancer cells (HepG-2) with inhibition percentage of 97.3, 96.3 %, while they showed moderate potency against the breast carcinoma cell lines MCF-7 (growth inhibition 50.5 %). Fortunately, dual inhibition potency against both HepG-2 and MCF-7 cancer cell lines was gained by the imidazo[1,2-c]pyrimidine derivative 11a.

Also, the results indicated that the starting thiopyrimidine compound 1 and the acryloyl -phenylamino thiopyrimidine compound 7 showed moderate cytotoxic activity against the MCF-7 cancer cell lines (inhibition growth; 53, 68.9 %) with lack of activity against Hep-G2 cell lines. The rest of the tested derivatives produced no activity.

Further derivatization and optimization of heterocyclic compounds are required to get more active and wide spectrum anti-tumor potency.
