ABSTRACT

Amino thiophenecarboxylates 1a-d were heated with thiourea to afford 2-thioxothieno[3,2-d]pyrimidin-4(1H)-ones 2a-d. 2-(Methylthio)thieno[3,2-d]pyrimidin-4(1H)-ones 3a-d were synthesized by alkylation of substituted 2-thioxo derivatives 2a-d with methyl iodide. Compounds 3a-d were treated with (2-acetoxyethoxy)methyl bromide to afford 4a-d which were deacetylated to afford 5a-d. The anti-HBV activity of selected compounds was studied.

Keywords: Acyclic nucleosides, thienopyrimidines, acyclovir, anti-hepatitis activity.

INTRODUCTION

Nucleoside analogues play an important role in pharmacology, mainly as antitumoral or antiviral drugs [1-7]. The wide prevalence of Hepatitis B virus (HBV) infection and the lack of an ideal drug to treat the virus, has a great degree of prominence. Vaccination is not an effective therapy in chronic infections that ended by cirrhosis of the liver and/or hepatocellular carcinoma. In this respect alpha interferon has demonstrated some promise [8]. Thiated pyrimidinones, and their nucleosides, are of considerable biological importance [9]. Various analogues of thioptymidines possess effective antibacterial, antifungal, antiviral, insecticidal, and miticidal activities [10]. They are components of the tRNA of virous microorganism [11], yeasts [12], and mammalian cells [13] as a result of post-transcriptional modifications at the level of precursor tRNA, and splay a significant role in translation and its control [11, 14]. A comprehensive review covering the chemistry and antiviral activities of acyclonucleosides is available [15, 16], as reviews covering the biochemical properties of the potent antiviral agent acyclovir and nucleosides acting as inhibitors of HIV replication [17]. Acyclovir 9-(2-hydroxyethoxymethyl)guanine (ACV) (Zovirax) [18-21] (Fig. 1) has played a key role as a lead compound in this class of nucleosides. Due to the clinical efficacy of acyclovir, a number of purine and pyrimidine acyclic nucleosides were prepared.
MATERIALS AND METHODS

Synthetic methods, analytical and spectral data

The melting points were measured on a Büchi melting point apparatus and are uncorrected. $^1$H and $^{13}$C NMR spectra were recorded on a Varian NMR spectrometer at 300 MHz for $^1$H NMR and 75 MHz for $^{13}$C NMR with TMS as an internal standard. EIMS and FABMS spectra were recorded with a Finnigan MAT 312/AMD. Chemical shifts were reported in δ scale (ppm) relative to TMS as a standard, and the coupling constants (J values) are given in Hz. The progress of the reactions was monitored by TLC using aluminum silica gel plates 60 F$_{254}$. The microanalyses were performed at the microanalytical unit, Cairo University, Egypt, and were found to agree favorably with the calculated values. Antiviral activity against HBV was tested at the Liver Institute, Menoufia University, Shebin El-Koom Egypt.

Chemistry

7-Aryl-2-thioxothieno[3,2-d]pyrimidin-4(1H)-ones 2a-d

Thiophene derivatives 1a-d (0.1 mole) and thiourea (30.4 g, 0.4 mole) in DMF (50 mL) were heated at 200 °C for 2 h. The residue was poured into water and the resulting precipitate was washed with acetic acid, water and diethy ether respectively to give 2a-d.

1-(2-Acetoxyethoxy)methyl-7-aryl-2-(methylthio)thieno[3,2-d]pyrimidin-4(1H)-ones 3a-d

To a stirred dispersion of 2-methylthio derivatives 3a-d (5 mmol) in dry DMF (20 ml) was added NaN₃ (0.12 g, 5 mmol) and after almost complete evolving of hydrogen, the mixture was heated to 80 °C for 1 h. Then, (2-acetoxyethoxy)methyl bromide [22] (1.0 g, 5 mmol) was added, the reaction mixture stirred for additional 2-3 h at 80-90 °C, cooled to room temperature and filtered. The mixture was evaporated to dryness at reduced pressure and purified on silica gel column chromatography using 5% MeOH in CHCl₃ to give 4a-d in 89-91% yields.

Preparation and culture of Hep G2 2.2.15 cells
The required cell line was made by transfection of Hep G2-cells with a plasmid containing multiple tandem copies of HBV genome (subtype ayw) [23]. The 2.2.15 cell line was maintained in RPMI-1640 (Glutamax) culture media containing 100 IU/ml nystatin and 380 µg/ml G418 (geneticin). The transferred HEP G2-2.2.15 cell line was kept in tissue culture flask at 37°C + 5% CO₂. Subcultures were set up after a week by aspiration of the media from culture flask and washing the cells twice with PBS. A 10% versene/trypsin was added and the cells were incubated for 1 min. at 37°C. The drug Lamivudine which is a potent selective inhibitor of HBV replication [24] has been used as a standard for the comparative studies.
DNA Extraction
HBV-DNA extraction was done by mixing 10 µl of diluted supernatant (1:5 with PBS) in reaction tube with 10 µl of 0.2 M NaOH and incubated at 37°C for one hour. Carefully, 9.6 µl of 0.2 M HCl was added followed by 90 µl of TE buffer solution.

PCR-Ellisa
The PCR reaction mixture contained 14 µl extracted supernatant, 4 mmol/l MgCl$_2$, 10 µmol/l DIG-11-dUTP, 190 µmol/l dTTP, 200 µmol/l dATP, dGTP, dCTP, 1.5 U Taq polymerase, 20 mmol/l HCl (pH 8.4), 50 mmol/l KCl, 1 µmol/l HCID-1 primer (5’TGA TGG GAG GAG ATT AGG TT3’) and 1 µmol/l HCID-2 (5’TGA TGG GAG GAG ATT AGG TT3’), in total volume 50 µl. PCR reaction conditions were 32 cycles of 1 min. at 94°C, 30 sec. at 58°C and 30 sec. at 72°C + 3 sec. for each cycle in a thermal circler as described in literature [25].

Cytotoxicity Assay
A colorimetric assay for living cells utilized the colorless substrate 3-(3,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) that is modified to colored product by any living cells, but not by dead cells or tissue culture medium. The cytotoxic effect of the compounds was accessed by culturing the Hep G2-2.2.15 cells in the presence of compounds using a MTT-assay [26].

Calculation of IC$_{50}$, CC$_{50}$ and SI
The 50% inhibitory concentration of antiviral drugs (IC$_{50}$) was determined by interpolation from the plots of amount of DNA copies versus antiviral drug concentration. The 50% cytotoxic effect (CC$_{50}$) was calculated from the average viability of the cells with concentration of drugs. The selective index (SI) could be calculated as CC$_{50}$/IC$_{50}$ [26].

RESULTS AND DISCUSSION

Methyl 3-amino-4-substituted-2-thiophene-carboxylates 1a-d [27] were heated with thiourea in DMF and the resulting products precipitate at room temperature yielding 2a-d in 58-62%. 2-(Methylthio)thieno[3,2-d]pyrimidin-4(1H)-ones 3a-d were synthesized, in 79-87% yields, by treatment of substituted 2-thioxo derivatives 2a-d with methyl iodide and sodium hydroxide in water and ethanol at 60°C for 2h (Scheme 1).

![Scheme 1, Synthesis of Thienopyrimidines 2 and 3.](image)

The structure of compounds 2a-d and 3a-d were confirmed by $^1$H-NMR, $^{13}$C-NMR, and mass spectra which agreed with the assigned structures.
2-Methylthio derivatives 3a-d were alkylated with (2-acetoxethoxy)methyl bromide [22] by the method of Sasaki et al. [28] to give the corresponding acyclic nucleosides 4a-d in 89-91% yields after purification on silica gel column using 5% MeOH in CHCl₃. Deprotection of the acyclic nucleosides 4a-d using a mixture of ammonium hydroxide (25%) and methanol at room temperature afforded 5a-d, in 92-95% yields, after chromatographic purification using 10% MeOH in CHCl₃ (Scheme 2).

The structure of compounds 4a-d and 5a-d were confirmed by ¹H-NMR and mass spectra which agreed with the assigned structures.

Preliminary viral screening against HBV of selected compounds indicated that compound 8c was found to be active against HBV replication with IC₅₀ = 0.2 µM, CC₅₀ = 100 and selective index 500. Compounds 5a,b and 5d showed moderate viral replication inhibition and mild cytotoxicity with selective indexes 166.6 ~ 500.0. On the other hand, the compounds 2a-d and 3a-d showed low inhibition and high cytotoxicity with selective indexes 20.0 ~ 76.9 (Table 1).

CONCLUSION

New 2-(methylthio)thieno[3,2-d]pyrimidin-4(1H)-one analogues of ACV were synthesized in order to increase the number of tested compounds screened for antiviral activity. Some of them displayed promising activities.
