ABSTRACT

Two new, rapid, precise, accurate and specific chromatographic methods for the simultaneous determination of Telmisartan, Amlodipine besylate and Hydrochlorothiazide in combined pharmaceutical dosage forms. The first method based on reverse phase liquid chromatography by using Qualisil BDS C18 column (250 mm X 4.6 i.d., 5 µm). Mobile phase consists of 1.0 ml of triethylamine in one litre water and the pH was adjusted to 2.5 with orthophosphoric acid and Acetonitrile (60:40) with a flow rate of 1ml/min, with a detection wavelength of 281nm. The second method involved silica gel 60F254 high performance thin layer chromatography and densitometric detection at 281 nm using chloroform: methanol:formic acid(85:15:5) as the mobile phase.

Keywords: Telmisartan; Amlodipine besylate; Hydrochlorothiazide; high performance thin layer chromatography; reverse phase liquid chromatography.

INTRODUCTION

Telmisartan chemically it is 4’-[(1, 4’-dimethyl-2’-propyl [2, 6’-bi-1H-benzimidazol]-1’-yl) methyl] [1, 1’-biphenyl]-2-carboxylic acid. It works by blocking a substance in the body that causes blood vessels to tighten. As a result, it relaxes blood vessels. This lowers blood pressure and increases the supply of blood and oxygen to the heart [1]. Hydrochlorothiazide is 6-Chloro-3, 4-dihydro-2H-1, 2, 4-benzothiadiazine-7-sulfonamide 1, 1-dioxide. It reduces the amount of water in the body by increasing the flow of urine, which helps lower the blood pressure [2]. Amlodipine besylate is chemically 3-Ethyl 5-methyl (4RS)-2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methyl-1,4-dihydropyridine-3,5dicarboxylate benzene sulphonate salt of amlodipine, which is a dihydropyridine calcium channel blocker is a calcium antagonist inhibits the influx of extracellular calcium across the myocardial and vascular smooth muscle cell membranes. The decrease in intracellular calcium inhibits the contractile processes of the myocardial smooth muscle cells, causing dilation of the coronary and systemic arteries, increased oxygen delivery to the myocardial tissue, decreased total peripheral resistance, decreased systemic blood pressure, and decreased after load [3]. Telmisartan, Amlodipine besylate and Hydrochlorothiazide are introduced into the market in combined dosage form, which is widely used in the treatment of hypertension. Literature review reveals that the methods for Telmisartan, Amlodipine besylate and hydrochlorothiazide alone or in combined dosage forms are

MATERIALS AND METHODS

Chemicals
Telmisartan, Amlodipine besylate and Hydrochlorothiazide reference standards was supplied by M/s Microlabs limited, Bangalore, India. HPLC grade Acetonitrile, Triethylamine, orthophosphoric acid, methanol was purchased from Merck (Mumbai, India). All chemicals were of analytical grade. Commercially available tablets (Telegat Trio, Ranbaxy India), containing 20mg Olmesartan medoxomil, 5mg Amlodipine besylate and 12.5mg Hydrochlorothiazide per tablet, were used for analysis. Stock solutions (1.0 mg mL-1) for RP-LC and HPTLC were prepared in methanol.

High Performance Liquid Chromatography

Apparatus and Chromatographic Conditions
The determination was carried out on Agilent technologies 1220 series consisted of isocratic pump model G4286B liquid chromatographic system with 20µl loop manual injector was used. The analytes were separated on Agilent, Qualisil BDS C18 column (250 mm X 4.6 i.d., 5 µm particle diameters, made in USA). Mobile phase consists of 1.0 ml of triethylamine in one litre water and the pH was adjusted to 2.5 with orthophosphoric acid and Acetonitrile in the ratio of 60:40, filtered through 0.45µm Membrane filter and degassed through Agilent 1200 series vacuum degasser with flow rate 1 ml min.-1 with isocratic elution and the UV- Variable wave length detector Model G1314 was set at 281 nm using data handling system EZChrom Elite Compact 3.3.2 SP2 software. HPLC grade methanol used as diluent. All the determinations were performed at ambient temperature 25± 5 °C and the injection volume was 20 µl.

Calibration
For calibration purposes, a range of 10-50µg/ml for Telmisartan, 2-25µg/ml for amlodipine & 2.5-17.5µg/ml for hydrochlorothiazide solutions were prepared and 20 µL injections were carried out in triplicate.

Analysis of tablet formulations
Ten tablets were weighed and powdered uniformly in a mortar. An accurately weighed portion powder equivalent to 40mg of Telmisartan was transferred into a 100ml volumetric flask. 100ml of diluent was added, sonicated for 30minutes with occasional stirring. Cool the solution to room temperature and dilute to the volume with diluent.
filtered the solution through 0.45µm Teflon filter syringe. 1ml of the above filtered solution was transferred into a 10ml volumetric flask & dilute to the volume with diluent.

**Recovery study**
The accuracy of the proposed method was evaluated by the addition of a standard drug solution to a pre-analysed tablet sample solution at three different concentrations levels at 50, 100 and 150% of linearity for both drugs.

**High Performance Thin Layer Chromatography**

**Apparatus and Chromatographic conditions**
Samples were applied as 8 mm bands by means of a Camag Linomat V automatic samples applicator (Muttenz Switzerland) equipped with a 100 µL syringe. The distance between the bands was 11.4 mm. Silica gel 60 F 254 HPTLC plates (20x10 cm, aluminium) were from Merck (Darmstadt, Germany). Densitometric scanning was performed at 281 nm with a camag TLC scanner 3 equipped with camag Wincats software 1.42 using the deuterium light source and slit dimensions of 4.00 mm × 0.30 mm. Before use plates were washed with methanol and dried in an oven at 120°C for 20 min. ascending development of the plate with a migration distance of 50 mm was performed at 60°C using chloroform: methanol:formic acid (85:15:5v/v/v) as the mobile phase and a Camag twin-trough chamber previously saturated with mobile phase for 20 min. the average development time was 5 minutes.

**Calibration**
Mixed working standard solutions for all the three drugs (2.4, 6, 10, 12, 14, 16 18 µL) were separately spotted on the TLC plate in order to obtain final concentrations at 200, 300, 400, 500, 600,700,800, 900 ng spot -1 respectively. The plates were developed in a 20 × 10 cm twin through chamber using 20 mL freshly prepared mobile phase.

**Analysis of Tablet Formulation**
The tablets were weighed, triturated and the average weight was calculated. A 1.0 mg/mL solution was prepared in methanol and filtered through Whatman filter paper no. 41. The above stock was diluted in the ratio of 1:100 with methanol,further diluted in the ratio of 1:10 which is used as the working standard solutions. The solutions (1, 2,4,8,12,16 µL) were separately spotted on the HPTLC plate and the concentrations were calculated from the calibration graph.

**Recovery study**
The accuracy of the proposed method was evaluated by the addition of a standard drug solution at three different concentration levels at 50, 100, and 150% of linearity for both drugs.

**RESULTS AND DISCUSSION**

**High Performance Liquid Chromatography**
A satisfactory separation was obtained (Telmisartan Rt 6.08, Amlodipine besylate Rt 4.86 and Hydrochlorothiazide Rt 3.11) on Qualisil BDS (250 x 4.6, 5µ) column using mobile phase 1.0 ml of triethylamine in one litre water and the pH was adjusted to 2.5 with orthophosphoric acid and acetonitrile (60:40) with a flow rate of 1ml/min with a detection wavelength of 281nm for both the compounds with a injection volume of 20µl. (Fig.1). A calibration curve was made and concentration examined within the detection range of 10-50µg/ml for Telmisartan, 2-25µg/ml for amlodipine & 2.5-17.5µg/ml for hydrochlorothiazide and correlation coefficient was found to be 0.99 for all the drugs and the results are also shown in Table 1.

The assay values obtained by proposed method and recovery experiment values obtained were performed by adding a fixed amount of drug to preanalysed formulation summarized in Table 2. The stability of sample was checked by forced degradation in different conditions and the studies indicate that any other impurity is not merging with the main peak The analyte solution was stable up to 24hrs.A method was developed for the determination of Telmisartan, Amlodipine besylate & hydrochlorothiazide in tablets which is rapid, stable & specific. The results indicate that the described method can be used for quantitative analysis of the compounds.

**High Performance Thin Layer Chromatography**
A number of experimental parameters, such as mobile phase composition, scan modes and detection wavelengths, were optimized during method development in order to provide accurate, precise and reproducible results for the simultaneous determination of the three drugs.Maximum separation (Telmisartan Rf 0.73, Amlodipine besylate Rf
0.41 and Hydrochlorothiazide Rf 0.31) and minimum tailing were obtained when using a mobile phase composition of chloroform: methanol:formic acid (85:15:5 v/v) respectively (Fig. 2).

Table 1 shows that correlation coefficients were 0.99 for all the drugs. The LOD values were 100 ng spot\(^{-1}\), while LOQ values were 300 ng spot\(^{-1}\) for both Telmisartan and Hydrochlorothiazide respectively and for Amlodipine besylate LOD values were 200 ng spot\(^{-1}\), while LOQ values were 600 ng spot\(^{-1}\). The proposed method was used for the determination of both drugs in tablets and results are also shown in Table 2. Good recoveries and standard deviations were observed.

CONCLUSION

A method was developed for the determination of tablets which is simple, quick, reliable, inexpensive and simple. The results indicate that the described method can be used for quantitative analysis of the compound.
